

JakartaUpdate — WordPress Media Framework

Version 1.0.0 is a modular starter framework for Indonesian digital publishers. It packages a responsive theme, an editorial/core plugin, and an optional LIVE/TV plugin. The theme controls presentation, Core provides editorial/advertising utilities, and Live owns channel and program data.

Package structure

- `jakartaupdate/` — WordPress theme.
- `jakartaupdate-core/` — breaking ribbon, ticker, video post type, social links, ad slots, basic view counts, fallback SEO metadata/schema and admin settings.
- `jakartaupdate-live/` — channel/program post types and secure constrained stream output.
- `docs/` — installation and operations guides.

Requirements

WordPress 6.2 or newer and PHP 8.1 or newer. HTTPS is required for streams. Works with standard WordPress menus, Gutenberg content, common caching plugins and WooCommerce templates in principle; a full compatibility matrix needs validation against each site's active plugins and hosting stack.

Install

Upload and activate the theme, then upload and activate Core. Install Live only if needed. Create a page named “Live” with `[ju_live_tv]` ; configure **Appearance → Customize → JakartaUpdate → Live page URL**. See [INSTALL.md](#).

Not a claim of complete production verification

This package is a functional, extensible first release, not a guarantee of universal compatibility or broadcast reliability. The source is syntax-checked in this environment; live hosting, third-party SEO plugins, real stream endpoints, analytics consent requirements, and all viewport/plugin combinations must be tested on the target WordPress installation. Known gaps and setup steps are in `docs/ADMIN-GUIDE.md` .
